Logical and intuitive dimensions of life

When entering dimensions that do not make logical sense, intuition is of great help.

As logical thinking is one kind of sense, intuitive perception is another kind of sense. With the advent of the modern way of education, we have evolved logical thinking too much and completely disregarded or killed the intuitive dimension. As you destroy the intuitive and become more logical, every little thing in your life has to be thought out because you don’t really know anything. This is why you find that people today are unnecessarily stressed just handling their day-to-day activities.

Some time ago, I was browsing through a book shop and came across a book for new mothers. I was flipping through this book and the author was trying to tell the new mother that the child needs her physical contact, about how many times in a day she should kiss the child, that 124 kisses a day is healthy. Now, suppose you were busy in the morning and you want to deliver all 124 kisses in the evening, both you and your child will become physically and mentally ill. Logical thinking can do this to you. You need some sense, just knowing things the way they are. That is intuition. The intuitive is always cultivated in a completely different way – not desiring for it, but just keeping the necessary openness to it so that you simply know certain things about your life.
